I am learning C# and I just want to make sure I understand correctly: Basically a string object is a char array, right? So if I have the following code and I add Console.WriteLine("Hello world"); I understand that the output would be Hello world I hope this makes sense. Is it the same if I declared the strings as string hello = "Hello world"; A: First thing you should know about C# is that is a strongly typed language. I.e. a string is not just a char array. It is a string and contains a value of type char. The type of variable is always very important and you need to understand type of variable. The string type is immutable which means it can't be changed. You could create a new string variable that may be containing a new char[]. bool is_happy = true; // 1 string name = "Happy"; // 1 //this will change the value of "name" variable if (is_happy) name = "Sad"; //this will change the value of the variable name = "Happy"; In your second example, you create a new string variable with name = "Hello world" but you assign value only to that variable. To assign value, you will need to assign it to a variable which already has a value of type string and then assign that value to the variable name. I.e. string my_name = "Hello world"; // now you can assign value to "my_name" variable string name = my_name; Nabila Salim
