It isn't intended to be a full tutorial, but rather a quick introduction to the file formats. Because there are so many Photoshop tutorials out there, those unfamiliar with the basics of working in Photoshop should start with Photoshop's online tutorials or walkthroughs and then move on to working with GIMP. The GIMP and Photoshop file formats are fairly simple. GIMP, however, has only three main file types (PNG, JPEG, and TIFF), whereas Photoshop supports a full range of file formats. Many tutorials use examples of files that are popular among photographers, which include the following: **PNG and TIFF** : These are the best-supported formats in both applications. On Windows, PNG images can be opened directly in Paint.NET, an open source screenshot program. Photoshop can open all TIFF file formats. **JPEG** : Photoshop has better support for JPEG than GIMP does. Although you can create JPEG files in GIMP, they can't be opened by the program. **.psd** : Photoshop's default format for text edits is the.psd format. You can open this format in GIMP and other graphic editors, including Paint.NET.

Should we add cystatin C to glomerular filtration rate? A systematic review. The National Kidney Foundation has made a recommendation that cystatin C be incorporated into estimating glomerular filtration rate (GFR) in routine clinical practice. Although cystatin C is freely filtered at the glomerulus, it has a reabsorptive component that is counterbalanced by a similar filtration component. This equates to a flow rate-independent relationship between GFR and the serum concentration of cystatin C. Therefore, in routine clinical practice, serum cystatin C is expected to be a better surrogate marker of GFR than serum creatinine in individuals for whom the reabsorption of protein is small compared with its filtration. The issue that remains to be answered is whether the use of serum cystatin C will alter the diagnostic sensitivity and accuracy of an estimated GFR as compared with that derived from serum creatinine and the Modification of Diet in Renal Disease (MDRD) equation. Evidence for the use of cystatin C is reviewed to determine the number of trials that are required in order to assess how relevant the inclusion of serum cystatin C will be in clinical practice. The MDRD equation is the standard for estimating GFR. Although serum creatinine is one component of the MDRD equation, it is the creatinine concentration and not the creatinine clearance. Therefore, it is inappropriate to substitute estimated GFR for the absolute GFR without first taking into account the MDRD equation. Thus, it is important to understand how the incorporation of cystatin C will affect the diagnostic sensitivity and accuracy of the estimated GFR derived from the MDRD equation. It is conventional practice to employ spiral-wound rolls, such as used in the making of fabric, in order to impart a degree of longitudinal stretch to such fabric. The edge of the fabric can be stretched along the length of the width of the fabric. However, the spiral-wound rolls for the purpose of imparting the longitudinal stretch to the fabric tend to cause air-faulting, which occurs when the fabric shrinks in the longitudinal direction as the fabric passes through the nip of the spiral-wound rolls. The air-faulting causes an undesirable buckling of the fabric in the longitudinal direction, especially when the fabric is elastic. In addition to the air-faulting, the edge of the fabric tends to
